## To accompany Chapter 5.2 Fourier transforms of commonly occurring signals

This worksheet can be downloaded as a [PDF file](#). We will step through this worksheet in class.

An annotatable copy of the notes for this presentation will be distributed before the second class meeting as **Worksheet 13** in the **Week 6: Classroom Activities** section of the Canvas site. I will also distribute a copy to your personal **Worksheets** section of the **OneNote Class Notebook** so that you can add your own notes using OneNote.

You are expected to have at least watched the video presentation of [Chapter 5.2](#) of the [notes](#) before coming to class. If you haven't watch it afterwards!

After class, the lecture recording and the annotated version of the worksheets will be made available through Canvas.

## Reminder of the Definitions

Last time we derived the Fourier Transform by evaluating what would happen when a periodic signal was made periodic. Let us restate the definitions.

## The Fourier Transform

Used to convert a function of time  $f(t)$  to a function of radian frequency  $F(\omega)$ :

$$\mathcal{F}\{f(t)\} = \int_{-\infty}^{\infty} f(t)e^{-j\omega t} dt = F(\omega).$$

## The Inverse Fourier Transform

Used to convert a function of frequency  $F(\omega)$  to a function of time  $f(t)$ :

$$\mathcal{F}^{-1}\{F(\omega)\} = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(\omega) e^{j\omega t} d\omega = f(t).$$

Note, the factor  $2\pi$  is introduced because we are changing units from radians/second to seconds.

## Duality of the transform

Note the similarity of the Fourier and its Inverse.

This has important consequences in filter design and later when we consider sampled data systems.

## Table of Common Fourier Transform Pairs

This table is adapted from Table 8.9 of Karris. See also: [Wikibooks: Engineering Tables/Fourier Transform Table](#) and [Fourier Transform—WolframMathworld](#) for more complete references.

	Name	$f(t)$	$F(\omega)$	Remarks
1.	Dirac delta	$\delta(t)$	1	Constant energy at <i>all</i> frequencies.
2.	Time sample	$\delta(t - t_0)$	$e^{-j\omega t_0}$	
3.	Phase shift	$e^{j\omega_0 t}$	$2\pi\delta(\omega - \omega_0)$	
4.	Signum	$\text{sgn } t$	$\frac{2}{j\omega}$	also known as sign function
5.	Unit step	$u_0(t)$	$\frac{1}{j\omega} + \pi\delta(\omega)$	
6.	Cosine	$\cos \omega_0 t$	$\pi [\delta(\omega - \omega_0) + \delta(\omega + \omega_0)]$	
7.	Sine	$\sin \omega_0 t$	$-j\pi [\delta(\omega - \omega_0) - \delta(\omega + \omega_0)]$	
8.	Single pole	$e^{-at}u_0(t)$	$\frac{1}{j\omega + a}$	$a > 0$
9.	Double pole	$te^{-at}u_0(t)$	$\frac{1}{(j\omega + a)^2}$	$a > 0$
10.	Complex pole (cosine component)	$e^{-at} \cos \omega_0 t u_0(t)$	$\frac{j\omega + a}{(j\omega + a)^2 + \omega_0^2}$	$a > 0$
11.	Complex pole (sine component)	$e^{-at} \sin \omega_0 t u_0(t)$	$\frac{\omega_0}{(j\omega + a)^2 + \omega_0^2}$	$a > 0$

## Some Selected Fourier Transforms

### The Dirac Delta

$$\delta(t) \Leftrightarrow 1$$

*Proof:* uses sampling and sifting properties of  $\delta(t)$ .

*MATLAB:*

```
syms t omega omega_0 t0;
u0(t) = heaviside(t); % useful utility function
fourier(dirac(t))
```

Related:

$$\delta(t - t_0) \Leftrightarrow e^{-j\omega t_0}$$

```
fourier(dirac(t - t0), omega)
```

## DC

$$1 \Leftrightarrow 2\pi\delta(\omega)$$

*MATLAB:*

```
A = sym(1); % take one to be a symbol
fourier(A, omega)
```

Related by frequency shifting property:

$$e^{j\omega_0 t} \Leftrightarrow 2\pi\delta(\omega - \omega_0)$$

## Cosine (Sinewave with even symmetry)

$$\cos(t) = \frac{1}{2}(e^{j\omega_0 t} + e^{-j\omega_0 t}) \Leftrightarrow \pi\delta(\omega - \omega_0) + \pi\delta(\omega + \omega_0)$$

Note:  $f(t)$  is real and even.  $F(\omega)$  is also real and even.

MATLAB:

```
fourier(cos(omega_0*t), omega)
```

## Sinewave

$$\sin(t) = \frac{1}{j2} (e^{j\omega_0 t} - e^{-j\omega_0 t}) \Leftrightarrow -j\pi\delta(\omega - \omega_0) + j\pi\delta(\omega + \omega_0)$$

Note:  $f(t)$  is real and odd.  $F(\omega)$  is imaginary and odd.

MATLAB:

```
fourier(sin(omega_0*t), omega)
```

## Signum (Sign)

The signum function is a function whose value is equal to

$$\operatorname{sgn} t = \begin{cases} -1 & t < 0 \\ 0 & t = 0 \\ +1 & t > 0 \end{cases}$$

MATLAB:

```
fourier(sign(t), omega)
```

The transform is:

$$\operatorname{sgn} t = u_0(t) - u_0(-t) = \frac{2}{j\omega}$$

This function is often used to model a *voltage comparitor* in circuits.

## Example 4: Unit Step

Use the signum function to show that

$$\mathcal{F}\{u_0(t)\} = \pi\delta(\omega) + \frac{1}{j\omega}$$

### Clue

Define

$$\operatorname{sgn} t = 2u_0(t) - 1$$

Does that help?

MATLAB:

```
fourier(u0(t),omega)
```

## Example 5

Use the results derived so far to show that

$$e^{j\omega_0 t} u_0(t) \Leftrightarrow \pi \delta(\omega - \omega_0) + \frac{1}{j(\omega - \omega_0)}$$

Hint: linearity plus frequency shift property.

## Example 6

Use the results derived so far to show that

$$\sin \omega_0 t u_0(t) \Leftrightarrow \frac{\pi}{j2} [\delta(\omega - \omega_0) - \delta(\omega + \omega_0)] + \frac{\omega_0}{\omega_0^2 - \omega^2}$$

Hint: Euler's formula plus solution to example 5.

**Important note:** the equivalent example in Karris (Section 8.4.9 Eq. 8.75 pp 8-23—8-24) is wrong!

See worked solution in OneNote for corrected proof.

## Example 7

Use the result of Example 3 to determine the Fourier transform of  $\cos \omega_0 t u_0(t)$ .

Answer

$$\cos \omega_0 t \, u_0(t) \Leftrightarrow \frac{\pi}{2} [\delta(\omega - \omega_0) + \delta(\omega + \omega_0)] + \frac{j\omega}{\omega_0^2 - \omega^2}$$

## Derivation of the Fourier Transform from the Laplace Transform

If a signal is a function of time  $f(t)$  which is zero for  $t \leq 0$ , we can obtain the Fourier transform from the Laplace transform by substituting  $s$  by  $j\omega$ .

### Example 8: Single Pole Filter

Given that

$$\mathcal{L}\{e^{-at}u_0(t)\} = \frac{1}{s+a}$$

Compute

$$\mathcal{F}\{e^{-at}u_0(t)\}$$

### Example 9: Complex Pole Pair cos term

Given that

$$\mathcal{L}\{e^{-at} \cos \omega_0 t u_0(t)\} = \frac{s + a}{(s + a)^2 + \omega_0^2}$$

Compute

$$\mathcal{F}\{e^{-at} \cos \omega_0 t u_0(t)\}$$

## Fourier Transforms of Common Signals

We shall conclude this session by computing as many of the the Fourier transform of some common signals as we have time for.

- rectangular pulse
- triangular pulse
- periodic time function
- unit impulse train (model of regular sampling)
