Transfer Functions for Circuits

When doing circuit analysis with components defined in the complex frequency domain, the ratio of the output voltage $V_{\rm out}(s)$ to the input voltage $V_{\rm in}(s)$ under zero initial conditions is of great interest.

This ratio is known as the *voltage transfer function* denoted $G_v(s)$:

$$G_v(s) = \frac{V_{\text{out}}(s)}{V_{\text{in}}(s)}$$

Similarly, the ratio of the output current $I_{out}(s)$ to the input current $I_{in}(s)$ under zero initial conditions, is called the *current transfer function* denoted $G_i(s)$:

$$G_i(s) = \frac{I_{\text{out}}(s)}{I_{\text{in}}(s)}$$

In practice, the current transfer function is rarely used, so we will use the voltage transfer function denoted:

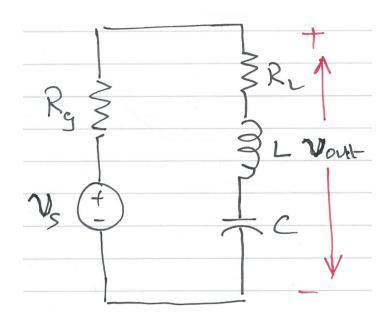

$$G(s) = \frac{V_{\text{out}}(s)}{V_{\text{in}}(s)}$$

Examples

See <u>worksheet7</u> (<u>worksheet7</u>) for the worked solutions to the examples. We will work through these in class. Here' I'll demonstrate the MATLAB solutions.

Example 6

Derive an expression for the transfer function G(s) for the circuit below. In this circuit R_g represents the internal resistance of the applied (voltage) source v_s , and R_L represents the resistance of the load that consists of R_L , L and C.

Sketch of Solution

- Replace $v_s(t)$, R_g , R_L , L and C by their transformed (complex frequency) equivalents: $V_s(s)$, R_g , R_L , sL and 1/(sC)
- Use the *Voltage Divider Rule* to determine $V_{\mathrm{out}}(s)$ as a function of $V_s(s)$
- Form G(s) by writing down the ratio $V_{\mathrm{out}}(s)/V_s(s)$

Worked solution.

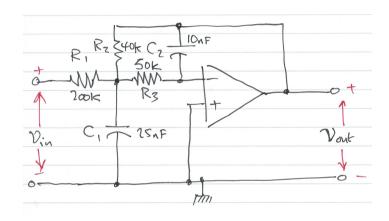

Pencast: ex6.pdf (../worked examples/ex6.pdf) - open in Adobe Acrobat Reader.

Answer

$$G(s) = \frac{V_{\text{out}}(s)}{V_s(s)} = \frac{R_L + sL + 1/sC}{R_g + R_L + sL + 1/sC}.$$

Example 7

Compute the transfer function for the op-amp circuit shown below in terms of the circuit constants R_1 , R_2 , R_3 , C_1 and C_2 .

Then replace the complex variable s with $j\omega$, and the circuit constants with their numerical values and plot the magnitude

$$|G(j\omega)| = \frac{|V_{\text{out}}(j\omega)|}{|V_{\text{in}}(j\omega)|}$$

versus radian frequency ω rad/s.

Sketch of Solution

- Replace the components and voltages in the circuit diagram with their complex frequency equivalents
- Use nodal analysis to determine the voltages at the nodes either side of the 50K resistor R_3

- · Note that the voltage at the input to the op-amp is a virtual ground
- Solve for $V_{\rm out}(s)$ as a function of $V_{\rm in}(s)$
- Form the reciprocal $G(s) = V_{\rm out}(s)/V_{\rm in}(s)$
- Use MATLAB to calculate the component values, then replace s by $j\omega$.
- Plot

$$|G(j\omega)|$$

on log-linear "paper".

Worked solution.

Pencast: ex7.pdf (../worked examples/ex7.pdf) - open in Adobe Acrobat Reader.

Answer

Swer
$$G(s) = \frac{V_{\text{out}}(s)}{V_{\text{in}}(s)} = \frac{-1}{R_1 \left((1/R_1 + 1/R_2 + 1/R_3 + sC_1) \left(sC_2R_3 \right) + 1/R_2 \right)}.$$

Using Transfer Functions in MATLAB for System Analysis

Please use the file <u>tf_matlab.m (../matlab/tf_matlab.m)</u> to explore the Transfer Function features provide by MATLAB. Open the file as a Live Script to see a nicely formatted document.

Using Transfer Functions in Simulink for System Simulation

The Simulink transfer function (**Transfer Fcn**) block implements a transfer function

The transfer function block represents a general input output function

$$G(s) = \frac{N(s)}{D(s)}$$

and is not specific nor restricted to circuit analysis.

It can, however be used in modelling and simulation studies.

Example

Recast Example 7 as a MATLAB problem using the LTI Transfer Function block.

For simplicity use parameters $R_1=R_2=R_3=1~\Omega$, and $C_1=C_2=1~\mathrm{F}$.

Calculate the step response using the LTI functions.

Verify the result with Simulink.

The Matlab solution: example8.m (../matlab/example8.m)

MATLAB Solution

From a previous analysis the transfer function is:

$$G(s) = \frac{V_{\text{out}}}{V_{\text{in}}} = \frac{-1}{R_1 \left[(1/R_1 + 1/R_2 + 1/R_3 + sC_1)(sR_3C_2) + 1/R_2 \right]}$$

so substituting the component values we get:

$$G(s) = \frac{V_{\text{out}}}{V_{\text{in}}} = \frac{-1}{s^2 + 3s + 1}$$

We can find the step response by letting $v_{\rm in}(t)=u_0(t)$ so that $V_{\rm in}(s)=1/s$ then

$$V_{\text{out}}(s) = \frac{-1}{s^2 + 3s + 1} \cdot \frac{1}{s}$$

We can solve this by partial fraction expansion and inverse Laplace transform as is done in the text book with the help of MATLAB's residue function.

Here, however we'll use the LTI block.

Define the circuit as a transfer function

In [20]:

$$G = tf([-1],[1 \ 3 \ 1])$$

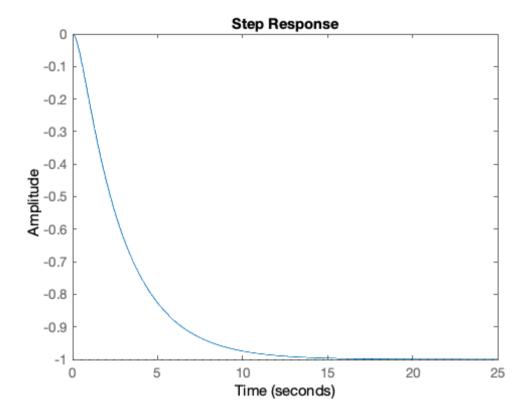

G =

Continuous-time transfer function.

step response is then:

In [21]:

step(G)

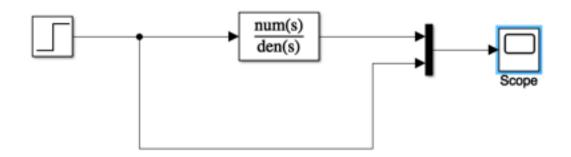

Simples!

Simulink model
