# **o**

# Worksheet 17

# To accompany Models of Discrete-Time Systems

# Colophon

This worksheet can be downloaded as a PDF file. We will step through this worksheet in class.

An annotatable copy of the notes for this presentation will be distributed before the second class meeting as **Worksheet 17** in the **Week 9: Classroom Activities** section of the Canvas site. I will also distribute a copy to your personal **Worksheets** section of the **OneNote Class Notebook** so that you can add your own notes using OneNote.

You are expected to have at least watched the video presentation of <u>Models of Discrete-Time Systems</u> of the <u>notes</u> before coming to class. If you haven't watch it afterwards!

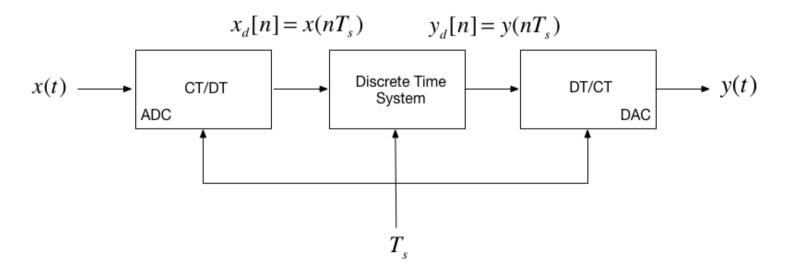

After class, the lecture recording and the annotated version of the worksheets will be made available through Canvas.

# Agenda

- Discrete Time Systems (Notes)
- Transfer Functions in the Z-Domain (Notes)
- Modelling digital systems in MATLAB/Simulink
- Converting Continuous Time Systems to Discrete Time Systems
- Example: Digital Butterworth Filter

# Discrete Time Systems

In the lecture that introduced the z-transform we talked about the representation of a discrete-time (DT) system by the model shown below:

In this session, we want to explore the contents of the central block.

# Example 5

Karris Example 9.10:

The difference equation describing the input-output relationship of a DT system with zero initial conditions, is:

$$y[n] - 0.5y[n-1] + 0.125y[n-2] = x[n] + x[n-1]$$

Example 5

Modelling DT systems in MATLAB and Simulink

N 4 A T 1 A F

<u>MATLAB</u>

Simulink Model

Converting Continuous Time Systems
to Discrete Time Systems

Continuous System Equivalents

MATLAB c2d function

Example: Digital Butterworth Filter

Solution

- 1. The transfer function H(z)
- 2. The DT impulse response h[n]
- 3. The response y[n] when the input x[n] is the DT unit step  $u_0[n]$

## 5.1. The transfer function

$$H(z) = \frac{Y(z)}{U(z)} = \dots?$$

## 5.2. The DT impulse response

Start with:

$$\frac{H(z)}{z} = \frac{z+1}{z^2 + 0.5z + 0.125}$$

#### **MATLAB Solution**

clear all
imatlab\_export\_fig('print-svg') % Static svg figures.
cd matlab
pwd
format compact

See <a href="https://dec.millows.com/dtm\_ex1\_2.ml">dtm\_ex1\_2.ml</a>. (Also available as <a href="https://dec.millows.com/dtm\_ex1\_2.ml">dtm\_ex1\_2.ml</a>.

The difference equation describing the input-output relationship of the DT system with zero initial conditions, is:

$$y[n] - 0.5y[n-1] + 0.125y[n-2] = x[n] + x[n-1]$$

Numerator  $z^2 + z$ 

```
Nz = [1 1 0];
```

Denominator  $z^2 - 0.5z + 0.125$ 

```
Dz = [1 -0.5 0.125];
```

Poles and residues

```
[r,p,k] = residue(Nz,Dz)
```

Impulse Response

```
Hz = tf(Nz,Dz,-1)
hn = impulse(Hz, 15);
```

Plot the response

```
stem([0:15], hn)
grid
title('Example 5 - Part 2')
xlabel('n')
ylabel('Impulse response h[n]')
```

Response as stepwise continuous y(t)

```
impulse(Hz,15)
grid
title('Example 5 - Part 2 - As Analogue Signal')
xlabel('nTs [s]')
ylabel('Impulse response h(t)')
```

## 5.3. The DT step response

$$Y(z) = H(z)X(z)$$

$$u_0[n] \Leftrightarrow \frac{z}{z-1}$$

$$Y(z) = H(z)U_0(z) = \frac{z^2 + z}{z^2 + 0.5z + 0.125} \cdot \frac{z}{z - 1}$$
$$= \frac{z(z^2 + z)}{(z^2 + 0.5z + 0.125)(z - 1)}$$

$$\frac{Y(z)}{z} = \frac{z^2 + z}{(z^2 + 0.5z + 0.125)(z - 1)}$$

Solved by inverse Z-transform.

## **MATLAB Solution**

See dtm\_ex1\_3.mlx. (Also available as dtm\_ex1\_3.m.)

```
open dtm_ex1_3
```

#### Results

# Modelling DT systems in MATLAB and Simulink

We will consider some examples in class

## **MATLAB**

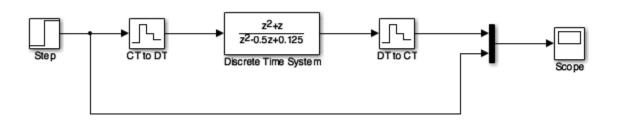

Code extracted from <a href="https://dtm.ex1\_3.m">dtm\_ex1\_3.m</a>:

```
Ts = 1;
z = tf('z', Ts);
```

```
Hz = (z^2 + z)/(z^2 - 0.5 * z + 0.125)
```

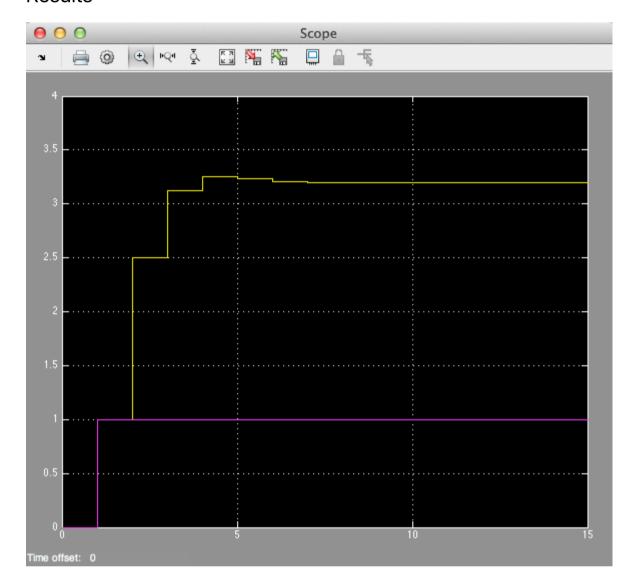

```
step(Hz)
grid
title('Example 1 - Part 3 - As Analogue Signal')
xlabel('nTs [s]')
ylabel('Step response y(t)')
axis([0,15,0,3.5])
```

See dtm.slx:

dtm

#### Results

# Converting Continuous Time Systems to Discrete Time Systems

# Continuous System Equivalents

- There is no digital system that uniquely represents a continuous system
- This is because as we are sampling, we only have knowledge of signals being processed at the sampling instants, and need to *reconstruct* the inter-sample behaviour.
- In practice, only a small number of transformations are used.
- The derivation of these is beyond the scope of this module, but here we'll demonstrate the ones that MATLAB provides in a function called c2d

## MATLAB c2d function

Let's see what the help function says:

help c2d

# Example: Digital Butterworth Filter

- Design a 2nd-order butterworth low-pass anti-aliasing filter with transfer function H(s) for use in sampling music.
- The cut-off frequency  $\omega_c=20$  kHz and the filter should have an attenuation of at least -80 dB in the stop band.
- Choose a suitable sampling frequency for the audio signal and give the transfer function H(z) and an algorithm to implement h[n]

## Solution

See digi butter.mlx.

First determine the cut-off frequency  $\omega_c$ 

$$\omega_c = 2\pi f_c = 2 \times \pi \times 20 \times 10^3 \text{ rad/s}$$

$$wc = 2*pi*20e3$$

$$\omega_c = 125.66 \times 10^3 \text{ rad/s}$$

From the lecture on filters, we know the 2nd-order butterworth filter has transfer function:

$$H(s) = \frac{Y(s)}{U(s)} = \frac{\omega_c^2}{s^2 + \omega_c \sqrt{2} s + \omega_c^2}$$

Substituting for  $\omega_c = 125.6637 \times 10^3$  this is ...?

$$Hs = tf(wc^2,[1 wc*sqrt(2), wc^2])$$

$$H(s) = \frac{15.79 \times 10^9}{s^2 + 177.7 \times 10^3 s + 15.79 \times 10^9}$$

#### Bode plot

MATLAB:

bode(Hs,{1e4,1e8})
grid

## Sampling Frequency

From the bode diagram, the frequency at which  $|H(j\omega)|$  is -80 dB is approx  $12.6 \times 10^6$  rad/s.

To avoid aliasing, we should choose a sampling frequency twice this =?

$$\omega_s = 2 \times 12.6 \times 10^6$$
 rad/s.

$$ws = 2* 12.6e6$$

So

$$\omega_s = 25.2 \times 10^6$$
 rad/s.

Sampling frequency  $(f_s)$  in Hz = ?

$$f_s = \omega_s/(2\pi) \text{ Mhz}$$

$$fs = ws/(2*pi)$$

$$f_s = 40.11 \text{ Mhz}$$

Sampling time  $T_s = ?$ 

$$Ts = 1/fs$$

$$T_s = 1/f_s \approx 0.25 \ \mu s$$

## Digital Butterworth

zero-order-hold equivalent

$$Hz = c2d(Hs, Ts)$$

#### Step response

step(Hz)

## Algorithm

From previous result:

$$H(z) = \frac{Y(z)}{U(z)} = \frac{486.6 \times 10^{-6} z + 476.5 \times 10^{-6}}{z^2 - 1.956z + 0.9567}$$

Dividing top and bottom by  $z^2 \dots$ 

$$H(z) = \frac{Y(z)}{U(z)} = \frac{486.6 \times 10^{-6} z^{-1} + 476.5 \times 10^{-6} z^{-2}}{1 - 1.956 z^{-1} + 0.9567 z^{-2}}$$

expanding out ...

$$Y(z) - 1.956z^{-1}Y(z) + 0.9567z^{-2}Y(z) =$$

$$486.6 \times 10^{-6}z^{-1}U(z) + 476.5 \times 10^{-6}z^{-2}U(z)$$

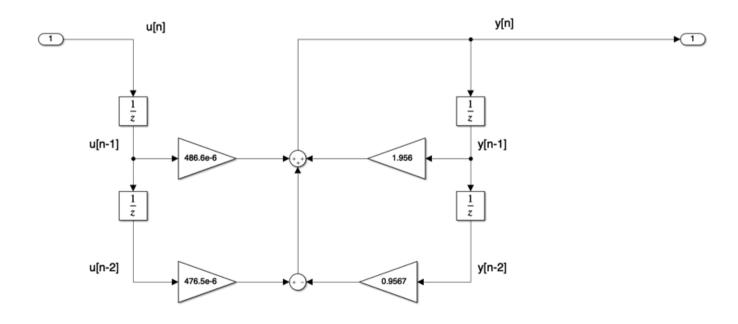

Inverse z-transform gives ...

$$y[n] - 1.956y[n-1] + 0.9567y[n-2] =$$
  
 $486.6 \times 10^{-6}u[n-1] + 476.5 \times 10^{-6}u[n-2]$ 

in algorithmic form (compute y[n] from past values of u and y) ...

$$y[n] = 1.956y[n-1] - 0.9567y[n-2] + 486.6 \times 10^{-6}u[n-1] + \dots$$
  
 $476.5 \times 10^{-6}u[n-2]$ 

#### Block Diagram of the digital BW filter

open digifilter

#### Convert to code

To implement:

```
y[n] = 1.956y[n-1] - 0.9567y[n-2] + 486.6 \times 10^{-6}u[n-1] + 476.5 \times 10^{-6}u[n-2]
```

```
/* Initialize */
Ts = 2.4933e-07; /* more probably some fraction of clock speed */
ynm1 = 0; ynm2 = 0; unm1 = 0; unm2 = 0;
while (true) {
    un = read_adc;
    yn = 1.956*ynm1 - 0.9567*ynm2 + 486.6e-6*unm1 + 476.5e-6*unm2;
    write_dac(yn);
    /* store past values */
    ynm2 = ynm1; ynm1 = yn;
    unm2 = unm1; unm1 = un;
    wait(Ts);
}
```
