Exponential Fourier Series

The source code for this page is <u>content/fourier_series/2/exp_fs1.ipynb</u>.

You can view the notes for this presentation as a webpage (HTML).

This section builds on our Revision of the to Trigonometrical Fourier Series.

Trigonometric Fourier series uses integration of a periodic signal multiplied by sines and cosines at the fundamental and harmonic frequencies. If performed by hand, this can a painstaking process. Even with the simplifications made possible by exploiting waveform symmetries, there is still a need to integrate cosine and sine terms, be aware of and able to exploit the

trigonometric identities, and the properties of *orthogonal functions* before we can arrive at the simplified solutions. This is why I concentrated on the properties and left the computation to a computer. However, by exploiting the exponential function e^{at} , we can derive a method for calculating the coefficients of the harmonics that is much easier to calculate by hand and convert into an algorithm that can be executed by computer. The result is called the *Exponential Fourier Series*.

Agenda Exponents and Euler's Equation

 The Exponential Fourier series Symmetry in Exponential Fourier Series

In [1]:

Example

- The Exponential Function e^{at} • You should already be familiar with e^{at} because it appears in the solution of differential equations.
- Case when a is real.

It pops up again and again in tables and properies of the Laplace Transform.

%% The decaying exponential t=linspace(-1,2,1000); figure plot(t, exp(t), t, exp(0.*t), t, exp(-t))

It is also a function that appears in the definition of the Laplace and Inverse Laplace Transform.

When a is real the function e^{at} will take one of the two forms illustrated below:

Some important values of ωt

Case where a is complex

variable *s* in the Laplace Transform

systems analysis and design. Look out for them in EG-243.

By use of trig. identities, it is relatively straight forward to show that:

Two Other Important Properties

The Exponential Fourier Series

Grouping terms with same exponents

The terms in parentheses are usually denoted as

Evaluation of the complex coefficients

The coefficients are obtained from the following expressions*:

By substituting C_{-k} and C_k back into the original expansion

Thus we can easily go back to the Trigonetric Fourier series if we want to.

Symmetry in Exponential Fourier Series

If we replace the cos and sin terms with their imaginary expontial equivalents:

The C_k coefficients, except for C_0 are *complex* and appear in conjugate pairs so

Trigonometric Fourier Series from Exponential Fourier Series

is a complex exponential.

and

cos(omegat) + jsin(omegat) 0.4 0.6

0.8

It was Leonhard Euler who discovered the formula visualized above.

omega t (rad)

This is the case that helps us simplify the computation of sinusoidal Fourier series.

Give the following:

•
$$e^{j\omega t}$$
 when $\omega t = 0$
• $e^{j\omega t}$ when $\omega t = \pi/2$
• $e^{j\omega t}$ when $\omega t = \pi$
• $e^{j\omega t}$ when $\omega t = 3\pi/2$
• $e^{j\omega t}$ when $\omega t = 2\pi$

We shall not say much about this case except to note that the Laplace transform equation includes such a number. The

 $\int_0^\infty f(t)e^{-st}\,dt$

The consequences of a complex s have particular significance in the development of system stability theories and in control

 $\cos \omega t = \frac{e^{j\omega t} + e^{-j\omega t}}{2}$

 $\sin \omega t = \frac{e^{j\omega t} - e^{-j\omega t}}{j2}$

We can use this result to convert the *Trigonometric Fourier Series* into an *Exponential Fourier Series* which has only one integral

 $f(t) = \frac{1}{2}a_0 + a_1 \cos \Omega_0 t + a_2 \cos 2\Omega_0 t + \cdots$

 $+b_1 \sin \Omega_0 t + b_2 \sin 2\Omega_0 t + \cdots$

 $+b_1\left(\frac{e^{j\Omega_0t}-e^{-j\Omega_0t}}{i2}\right)+b_2\left(\frac{e^{j2\Omega_0t}-e^{-j2\Omega_0t}}{i2}\right)+\cdots$

 $f(t) = \dots + \left(\frac{a_2}{2} - \frac{b_2}{i2}\right) e^{-j2\Omega_0 t} + \left(\frac{a_1}{2} - \frac{b_1}{i2}\right) e^{-j\Omega_0 t} + \frac{1}{2} a_0 + \left(\frac{a_1}{2} + \frac{b_1}{i2}\right) e^{j\Omega_0 t} + \left(\frac{a_2}{2} + \frac{b_2}{i2}\right) e^{j2\Omega_0 t} + \dots$

 $C_{-k} = \frac{1}{2} \left(a_k - \frac{b_k}{i} \right) = \frac{1}{2} (a_k + jb_k)$

 $f(t) = \dots + C_{-2}e^{-j2\Omega_0t} + C_{-1}e^{-j\Omega_0t} + C_0 + C_1e^{j\Omega_0t} + C_2e^{j2\Omega_0t} + \dots$

 $f(t) = \sum_{k=-n}^{n} C_k e^{jk\Omega_0 t}$

 $C_{-k} = C_k^*$

 $C_k = \frac{1}{2\pi} \int_0^{2\pi} f(\Omega_0 t) e^{-jk(\Omega_0 t)} d(\Omega_0 t)$

As as stated in the notes on the Trigonometric Fourier Series any periodic waveform f(t) can be represented as

These are useful when simplifying expressions that result from integrating functions that involve the imaginary exponential

$f(t) = \frac{1}{2}a_0 + a_1 \left(\frac{e^{j\Omega_0 t} + e^{-j\Omega_0 t}}{2}\right) + a_2 \left(\frac{e^{j2\Omega_0 t} + e^{-j2\Omega_0 t}}{2}\right) + \cdots$

New coefficents

The Exponential Fourier Series is

term to solve per harmonic.

 $C_k = \frac{1}{2} \left(a_k + \frac{b_k^2}{i} \right) = \frac{1}{2} (a_k - jb_k)$ $C_0 = \frac{1}{2}a_0$

$$C_k = \frac{1}{T} \int_0^T f(t) e^{-jk\Omega_0 t} \ dt$$
 These are much easier to derive and compute than the equivalent Trigonemetric Fourier Series coefficients.
* The analysis that leads to this result is provided between pages 7-31 and 7-32 of the text book. It is not a difficult proof, but we are more interested in the result.

 $C_k + C_{-k} = \frac{1}{2}(a_k - jb_k + a_k + jb_k)$

 $a_k = C_k + C_{-k}$

 $C_k - C_{-k} = \frac{1}{2}(a_k - jb_k - a_k - jb_k)$

 $b_k = j \left(C_k - C_{-k} \right)$

Since the coefficients of the Exponential Fourier Series are complex numbers, we can use symmetry to determine the form of

 $C_{-k} = \frac{1}{2} \left(a_k - \frac{b_k}{i} \right) = \frac{1}{2} (a_k + jb_k)$

 $C_k = \frac{1}{2} \left(a_k + \frac{b_k}{i} \right) = \frac{1}{2} (a_k - jb_k)$

From knowledge of the trig. fourier series, even functions have no sine terms so the b_k coefficients are 0. Therefore both C_{-k}

By a similar argument, all odd functions have no cosine terms so the a_k coefficients are 0. Therefore both C_{-k} and C_k are

From Trigonometric Fourier Series, if there is half-wave symmetry, all even harnonics are zero, thus both a_k and b_k are zero for

For n odd*, $e^{-jk\pi} = -1$. Therefore

• Square wave is an [odd/even/neither] function?

• Coefficients C_k are [real/imaginary/complex]?

• Square wave [has/does not have] half-wave symmetry?

• DC component is [zero/non-zero]?

If there is *half-wave symmetry*, $C_k = 0$ for k even.

k even. Hence C_{-k} and C_k are also zero when k is even.

Odd Functions For odd functions, all coefficients C_k are imaginary.

Relation of C_{-k} to C_k $C_{-k}=C_k^st$ always **Example 1**

Compute the Exponential Fourier Series for the square wave shown below assuming that $\omega=1$

If there is no symmetry the Exponential Fourier Series of f(t) is complex.

• Subscripts k are [odd only/even only/both odd and even]? • What is the integral that needs to be solved for C_k ?

Note sign change in first two terms. This is due to the fact that $C_{-k}=C_k^st.$ E.g. since $C_3 = 2A/j3\pi$, $C_{-3} = C_3^* = -2A/j3\pi$ Trig. Fourier Series from Exponential Fourier Series $f(t) = \frac{2A}{i\pi} \left(\dots - \frac{1}{3} e^{-j3\Omega_0 t} - e^{-j\Omega_0 t} + e^{j\Omega_0 t} + \frac{1}{3} e^{j3\Omega_0 t} + \dots \right)$ gathering terms at each harmonic frequency gives $f(t) = \frac{4A}{\pi} \left(\dots + \left(\frac{e^{j\Omega_0 t} - e^{-j\Omega_0 t}}{2i} \right) + \frac{1}{3} \left(\frac{e^{j3\Omega_0 t} - e^{-j3\Omega_0 t}}{2i} \right) + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin 3\Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \sin \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \frac{1}{3} \cos \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_0 t + \dots \right) = \frac{4A}{\pi} \left(\sin \Omega_$ $\sum_{t} \frac{1}{s} \sin k\Omega_0 t$ $\sum_{n=\text{odd}} k$ Computing coefficients of Exponential Fourier Series in MATLAB Verify the result of Example 1 using MATLAB. Summary Answers to in-class problems Some important values of ωt - Solution • When $\omega t = 0$: $e^{j\omega t} = e^{j0} = 1$ • When $\omega t = \pi/2$: $e^{j\omega t} = e^{j\pi/2} = j$ • When $\omega t = \pi$: $e^{j\omega t} = e^{j\pi} = -1$ • When $\omega t = 3\pi/2$: $e^{j\omega t} = e^{j3\pi/2} = -j$

• Square wave is an **odd** function! $C_k = \frac{1}{2\pi} \int_0^{2\pi} f(\Omega_0 t) e^{-jk(\Omega_0 t)} d(\Omega_0 t) = \frac{1}{2\pi} \left[\int_0^{\pi} A e^{-jk(\Omega_0 t)} d(\Omega_0 t) + \int_{\pi}^{2\pi} (-A) e^{-jk(\Omega_0 t)} d(\Omega_0 t) \right]$

Some answers for you

It is also worth being aware that $n\omega t$, when n is an integer, produces rotations that often map back to the simpler cases given above. For example see $e^{j2\pi}$ above.

3 ∠ c_k [radians] 2 3

• When $\omega t = 2\pi$: $e^{j\omega t} = e^{j2\pi}e^{j0} = 1$

$$\frac{C_n}{n=\mathrm{odd}} = \frac{A}{2j\pi k} \left(e^{-jk\pi}-1\right)^2 = \frac{A}{2j\pi k} (-1-1)^2 = \frac{A}{2j\pi k} (-2)^2 = \frac{2A}{j\pi k}$$
. You may want to verify that $C_0 = 0$ and
$$\frac{C_n}{n=\mathrm{even}} = 0.$$

$$\mathbf{Exponential Fourier series for the square wave with odd symmetry}$$
From the definition of the exponential Fourier series
$$f(t) = \cdots + C_{-2}e^{-j2\Omega_0 t} + C_{-1}e^{-j\Omega_0 t} + C_0 + C_1e^{j\Omega_0 t} + C_2e^{j2\Omega_0 t} + \cdots$$
the exponential Fourier series for the square wave with odd symmetry is
$$f(t) = \frac{2A}{j\pi} \left(\cdots - \frac{1}{3}e^{-j3\Omega_0 t} - e^{-j\Omega_0 t} + e^{j\Omega_0 t} + \frac{1}{3}e^{j3\Omega_0 t} + \cdots \right) = \frac{2A}{j\pi} \sum_{n=\mathrm{odd}} \frac{1}{n}e^{jk\Omega_0 t}$$
Note sign change in first two terms. This is due to the fact that $C_{-k} = C_k^*$.

E.g. since $C_3 = 2A/j3\pi$, $C_{-3} = C_3^* = -2A/j3\pi$

Trig. Fourier Series from Exponential Fourier Series
