Worksheet 13 To accompany Chapter 5.2 Fourier transforms of commonly occurring signals

This worksheet can be downloaded as a PDF file. We will step through this worksheet in class.

An annotatable copy of the notes for this presentation will be distributed before the second class meeting as Worksheet 13 in the Week 6: Classroom Activities section of the Canvas site. I will also distribute a copy to your personal Worksheets section of the OneNote Class Notebook so that you can add your own notes using OneNote.

You are expected to have at least watched the video presentation of Chapter 5.2 of the notes before coming to class. If you haven't watch it afterwards! After class, the lecture recording and the annotated version of the worksheets will be made available through Canvas.

Reminder of the Definitions Last time we derived the Fourier Transform by evaluating what would happen when a periodic signal was made periodic. Let us restate the definitions.

The Fourier Transform

Used to convert a function of time f(t) to a function of radian frequency $F(\omega)$:

 $\mathcal{F}\left\{f(t)\right\} = \int_{-\infty}^{\infty} f(t)e^{-j\omega t} dt = F(\omega).$ **The Inverse Fourier Transform**

Used to convert a function of frequency $F(\omega)$ to a function of time f(t):

 $\mathcal{F}^{-1}\left\{F(\omega)\right\} = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(\omega) e^{j\omega t} d\omega = f(t).$ Note, the factor 2π is introduced because we are changing units from radians/second to seconds.

Duality of the transform

This has important consequences in filter design and later when we consider sampled data systems.

more complete references.

Note the similarity of the Fourier and its Inverse.

Table of Common Fourier Transform Pairs This table is adapted from Table 8.9 of Karris. See also: Wikibooks: Engineering Tables/Fourier Transform Table and Fourier Transform—WolframMathworld for

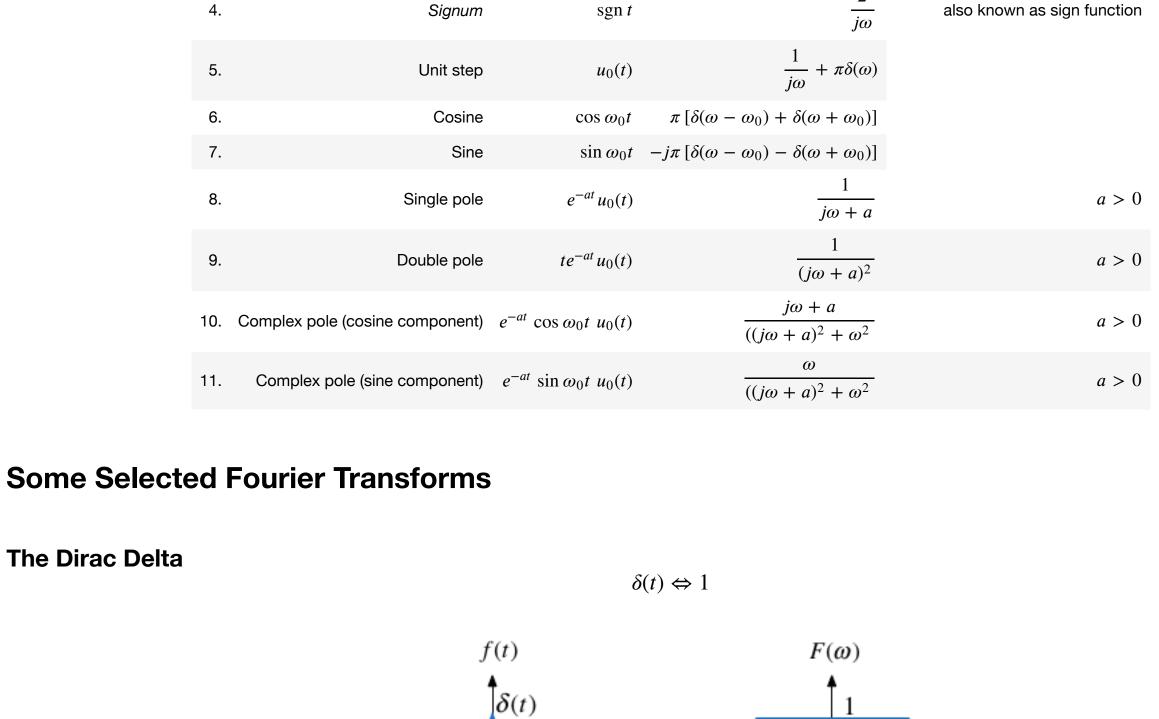

Name

 $\delta(t)$ 1. 1 Constant energy at all frequencies. Dirac delta $e^{-j\omega t_0}$ $\delta(t-t_0)$ Time sample $e^{j\omega t_0}$ $2\pi\delta(\omega-\omega_0)$ Phase shift

f(t)

 $F(\omega)$

Remarks

Proof: uses sampling and sifting properties of $\delta(t)$.

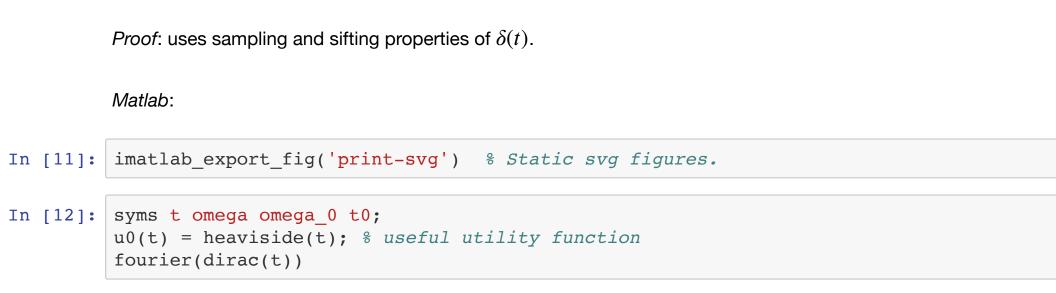

In [12]: syms t omega omega_0 t0;

fourier(dirac(t))

Matlab:

ans =

DC

Related: $\delta(t-t_0) \Leftrightarrow e^{-j\omega t_0}$ In [14]: fourier(dirac(t - t0), omega) exp(-omega*t0*1i)

f(t)

f(t)

 $\Phi \cos \omega_0 t$

Matlab: In [15]: A = sym(1); % take one to be a symbol fourier(A,omega)

ans =

Matlab:

ans =

Matlab:

Matlab:

ans =

-2i/omega

In [18]: fourier(sign(t),omega)

The transform is:

In [17]: fourier(sin(omega_0*t),omega)

Signum (Sign)

In [16]: fourier(cos(omega_0*t),omega)

2*pi*dirac(omega)

Related by frequency shifting property:

A = sym(1); % take one to be a symbol fourier(A,omega)
$$ans = 2*pi*dirac(omega)$$
 Related by frequency shifting property:
$$e^{j\omega_0 t} \Leftrightarrow 2\pi\delta(\omega-\omega_0)$$

$$cos(t) = \frac{1}{2} \left(e^{j\omega_0 t} + e^{-j\omega_0 t} \right) \Leftrightarrow \pi\delta(\omega-\omega_0) + \pi\delta(\omega+\omega_0)$$

 $1 \Leftrightarrow 2\pi\delta(\omega)$

 $F(\omega)$

 $2\pi\delta(\omega)$

 $+\omega_0$

 $-\omega_0$

Sinewave $\sin(t) = \frac{1}{j2} \left(e^{j\omega_0 t} - e^{-j\omega_0 t} \right) \Leftrightarrow -j\pi \delta(\omega - \omega_0) + j\pi \delta(\omega + \omega_0)$

pi*(dirac(omega - omega_0) + dirac(omega + omega_0))

Note: f(t) is real and even. $F(\omega)$ is also real and even.

Note: f(t) is real and odd. $F(\omega)$ is imaginary and odd.

-pi*(dirac(omega - omega_0) - dirac(omega + omega_0))*1i The signum function is a function whose value is equal to

 $\operatorname{sgn} t = u_0(t) - u_0(-t) = \frac{2}{j\omega}$

f(t)

-1

This function is often used to model a *voltage comparitor* in circuits.

 $F_{\rm Im}(\omega)$

Example 6

Example 7

Compute

Use the results derived so far to show that

Hint: Euler's formula plus solution to example 2.

See worked solution in OneNote for corrected proof.

Use the signum function to show that

 $\operatorname{sgn} t = 2u_0(t) - 1$

 $\mathcal{F}\left\{u_0(t)\right\} = \pi\delta(\omega) + \frac{1}{j\omega}$

From previous results $1 \Leftrightarrow 2\pi\delta(\omega)$ and $\operatorname{sgn} x = 2/(j\omega)$ so by linearity

In [19]: fourier(u0(t),omega) ans = pi*dirac(omega) - 1i/omega Example 5 Use the results derived so far to show that $e^{j\omega_0 t}u_0(t) \Leftrightarrow \pi\delta(\omega-\omega_0) + \frac{1}{j(\omega-\omega_0)}$ Hint: linearity plus frequency shift property.

 $\sin \omega_0 t \ u_0(t) \Leftrightarrow \frac{\pi}{j2} [\delta(\omega - \omega_0) - \delta(\omega + \omega_0)] + \frac{\omega_0}{\omega_0^2 - \omega^2}$

 $\operatorname{sgn} t = 2u_0(t) - 1$

 $u_0(t) = \frac{1}{2} + \frac{\operatorname{sgn} t}{2}$

 $u_0(t) \Leftrightarrow \pi \delta(\omega) + \frac{1}{j\omega}$

Use the result of Example 3 to determine the Fourier transform of $\cos \omega_0 t \ u_0(t)$.

Important note: the equivalent example in Karris (Section 8.4.9 Eq. 8.75 pp 8-23—8-24) is wrong!

Answer $\cos \omega_0 t \ u_0(t) \Leftrightarrow \frac{\pi}{2} [\delta(\omega - \omega_0) + \delta(\omega + \omega_0)] + \frac{j\omega}{\omega_0^2 - \omega^2}$ **Derivation of the Fourier Transform from the Laplace Transform** If a signal is a function of time f(t) which is zero for $t \le 0$, we can obtain the Fourier transform from the Laplace transform by substituting s by $j\omega$. **Example 8: Single Pole Filter** Given that Compute

Example 9: Complex Pole Pair cos term Given that

 $\mathcal{L}\left\{e^{-at}\cos\omega_0 t\ u_0(t)\right\} = \frac{s+a}{(s+a)^2 + \omega_0^2}$

 $\mathcal{F}\left\{e^{-at}\cos\omega_0t\ u_0(t)\right\}$

 rectangular pulse • triangular pulse • periodic time function • unit impulse train (model of regular sampling)

Fourier Transforms of Common Signals We shall conclude this session by computing as many of the the Fourier transform of some common signals as we have time for.
